Today's Agenda

- » Topic overview: *Human-AI Interaction*
- » Discussion

What are we talking about when we are talking about "AI?"

AI-infused systems: ... systems that have features harnessing AI capabilities that are directly exposed to the end user.¹

¹Amershi et al. (2019). Guidelines for human-AI interaction. CHI 2019.

Recap: Week 02: History of HCI

1960s: Man-Computer Symbiosis, 1960, Joseph Licklider, ARPA²

³

“Men will set the goals, formulate the hypotheses, determine the criteria, and perform the evaluations. Computing machines will do the routinizable work that must be done to prepare the way for insights and decisions in technical and scientific thinking.”

²Licklider (1960). Man-computer symbiosis. *IRE transactions on human factors in electronics*, (1), 4-11.

³Image source

But how can computers do this?

Attempts at Establishing Human-Computer Symbiosis

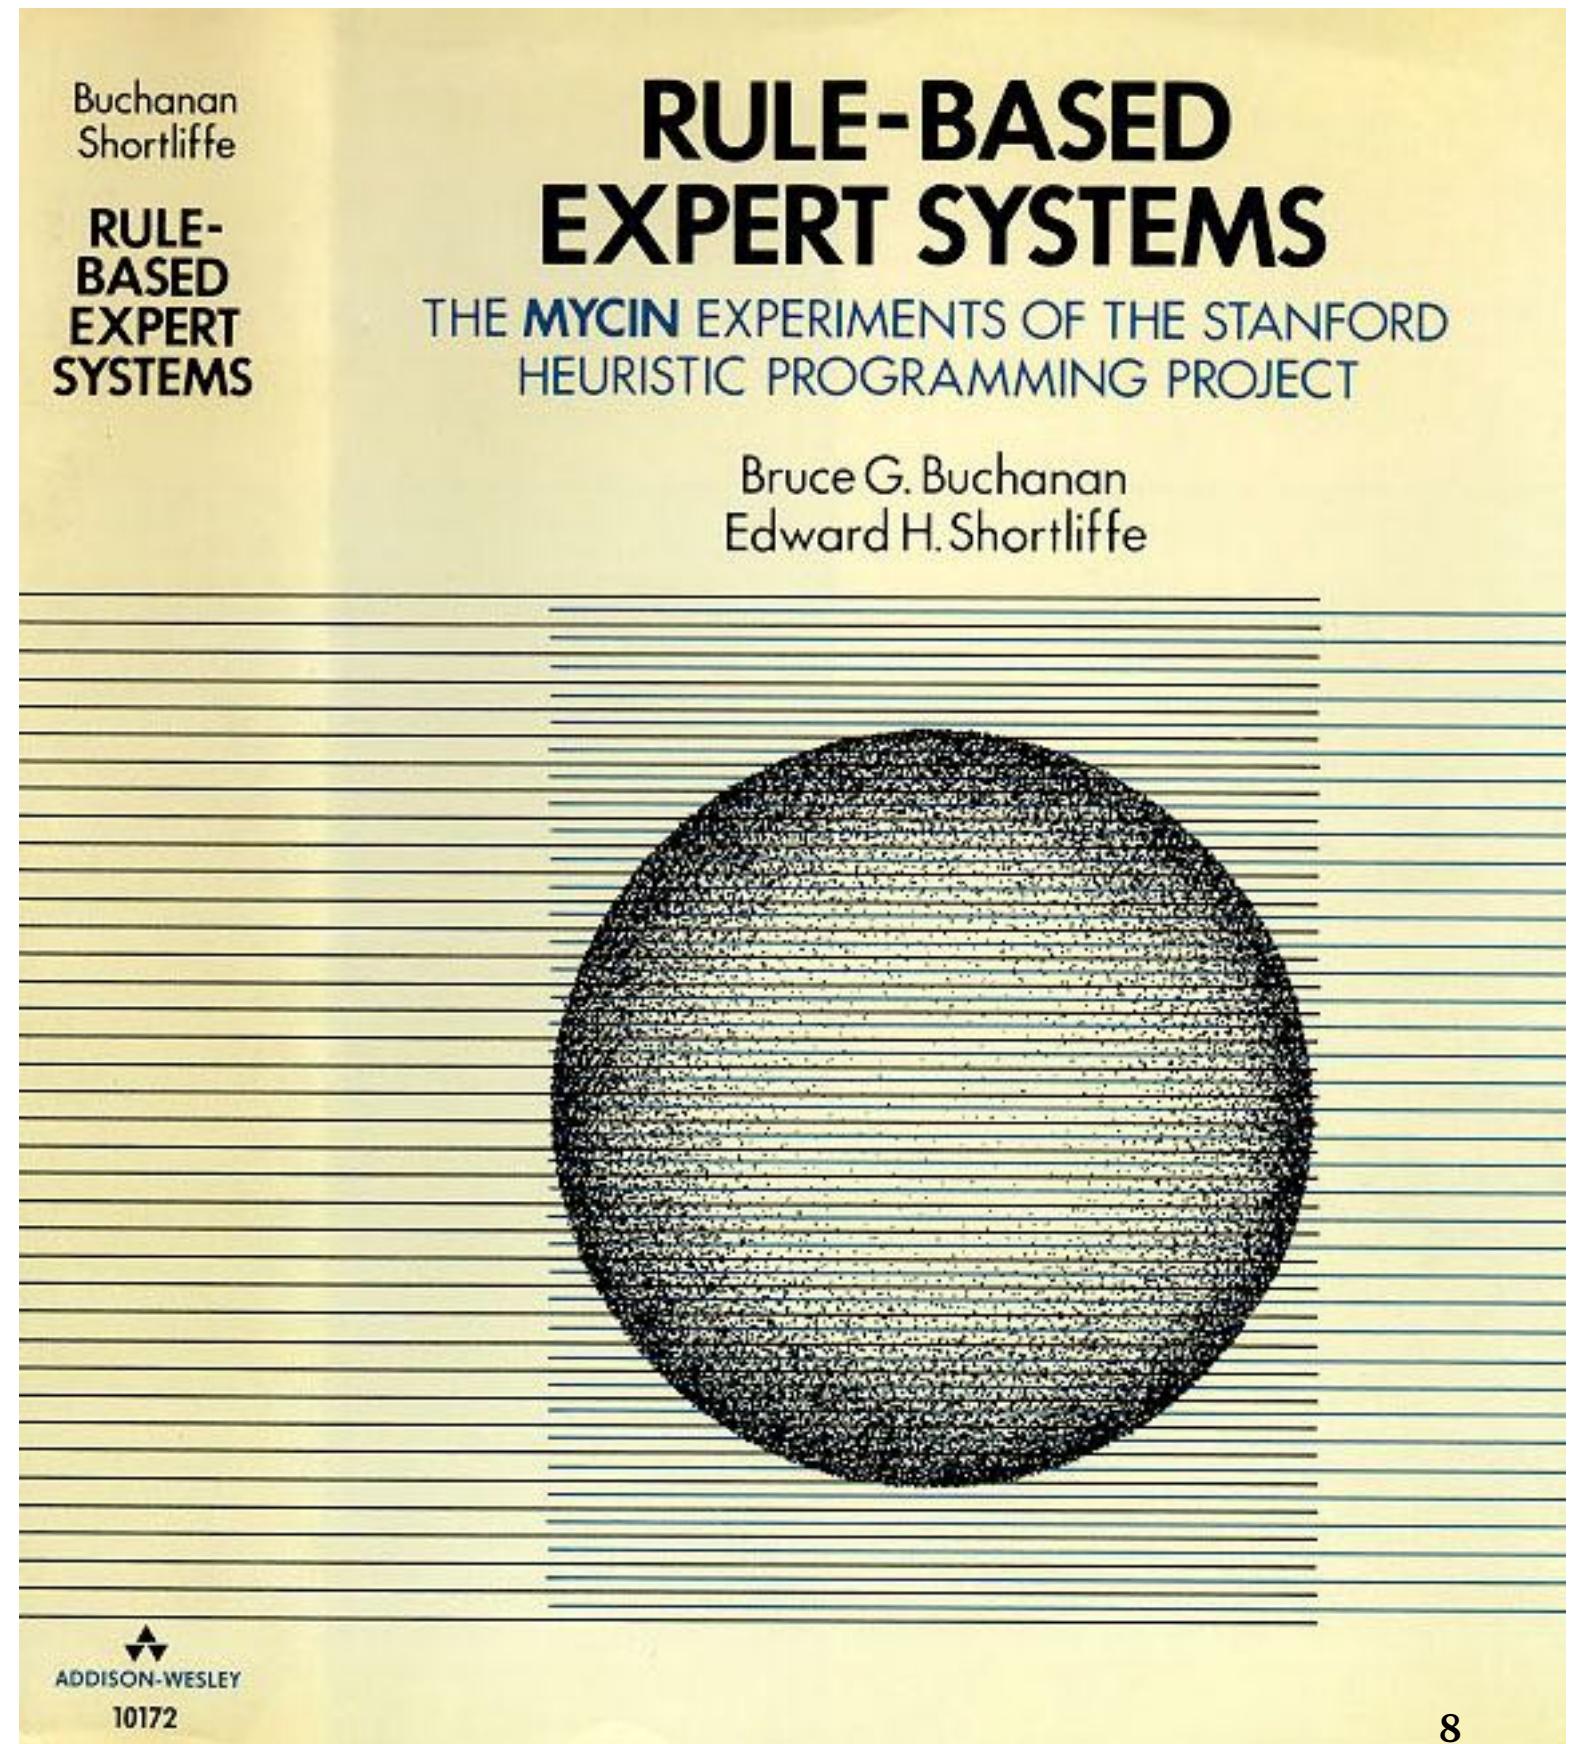

1960s-1970s: The rise of **expert systems**

Definition: **Expert system**, a computer program that uses artificial-intelligence methods to solve problems within a specialized domain that ordinarily requires human expertise. The first expert system was developed in 1965 by Edward Feigenbaum and Joshua Lederberg at Stanford.⁴

⁴ Britannica: expert system

The Problem with Expert Systems¹²

Production rules are a popular representation for encoding heuristic knowledge in programs for scientific and medical problem solving. However, experience with one of these programs, MYCIN, indicates that the representation has serious limitations: people other than the original rule authors find it difficult to modify the rule set, and the rules are unsuitable for use in other settings, such as for application to teaching. These problems are rooted in fundamental limitations in MYCIN's original rule representation: the view that expert knowledge can be encoded as a uniform, weakly-structured set of If/then associations is found to be wanting.⁵

Overcoming these Limitations: The Neural Net Revolution

- » **Milestone 1:** Neural Nets — initial inspiration from the human brain introduced in 1940s;⁶ practical applications started in late 1980s⁷
- » **Milestone 2:** Deep Learning — GPUs in the late 1990s, large datasets (e.g., ImageNet), unsupervised learning, GANs in mid-2010s⁸
- » **Milestone 3:** Transformers — transformer as a specific type of NN in 2017;⁹ BERT in 2018;¹⁰ commercial development of GPTs (2018–2023)¹¹

⁶ McCulloch & Pitts (1943). A logical calculus of the ideas immanent in nervous activity. *The bulletin of mathematical biophysics*, 5, 115–133.

⁷ LeCun et al. (1989). Backpropagation applied to handwritten zip code recognition. *Neural computation*, 1(4), 541–551.

⁸ A brief history of deep learning

¹¹ GPT-4: History, Creatures, and Predictions

*So we now have "machines" that can support human-machine
"symbiosis." What do we do now?¹³*

¹³ Images on next slide: [Left](#) | [Center](#) | [Right](#)

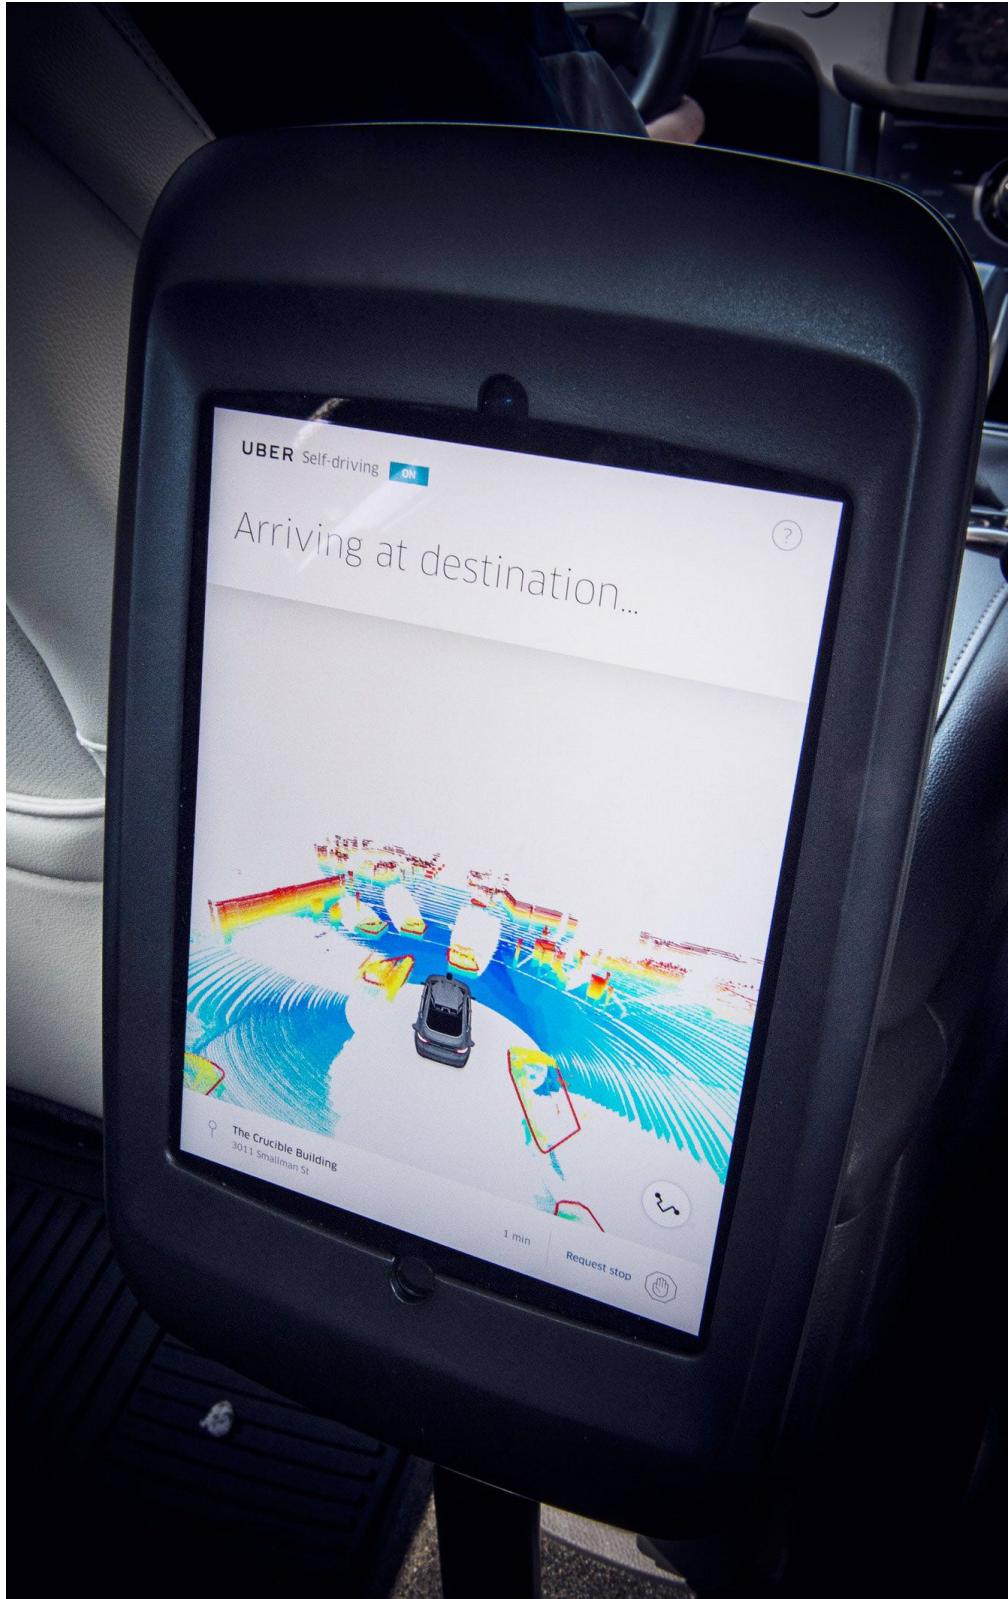

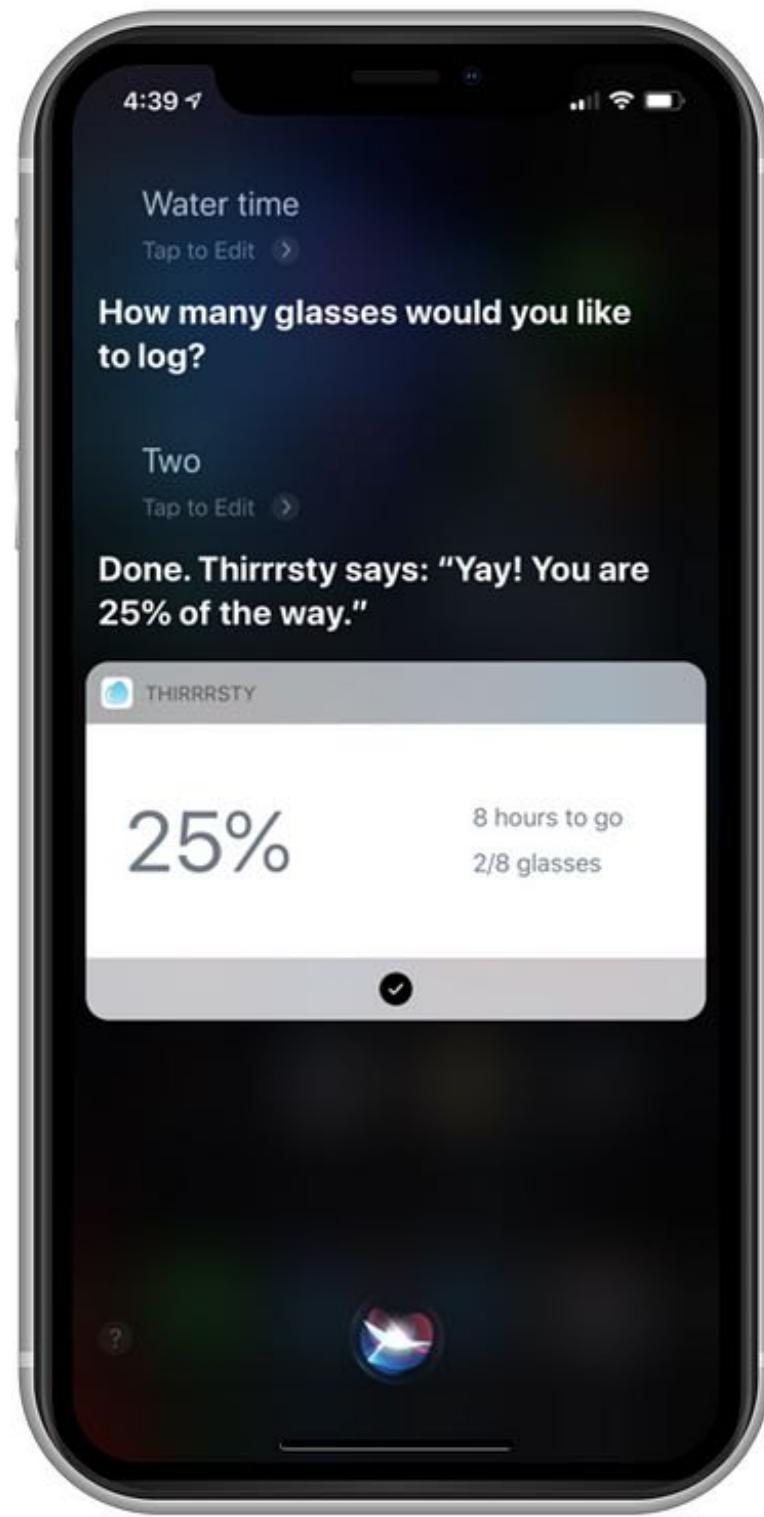

These interactions represent **intermittent** interaction scenarios, in which there is a clear line between the human initiator of an interaction and an almost immediate system response.^{14 15}

AI enables other forms of interaction:

- » **Intermittent human-AI interaction** describes systems that follow the notion of interaction between user and system as a turn-taking process.
- » **Continuous human-AI interaction** describes systems that “listen” to a stream of uninterrupted user input rather than individual instructions and can respond to this input throughout the duration of the interaction.
- » **Proactive human-AI interaction** describes systems that do not wait for user input but instead actively initiate and complete tasks based on, for example, sensor readings.

¹⁴Van Berkel et al. (2021). Human-AI interaction: intermittent, continuous, and proactive. *Interactions*, 28(6), 67-71.

¹⁵Images on next slide: [Left](#) | [Center](#) | [Right](#)

	Intermittent¹⁴	Continuous	Proactive
Initiator of interaction	User	User/AI	AI
Trigger for AI input	Explicit and predefined cue. For example, “Hey, Google.”	Implicit, as part of constant input. For example, a video feed on which each frame is analyzed.	Change in system state matching a predefined condition. For example, movement captured through a sensor.
Resulting AI response	System response to user in predefined format. For example, “Temperature in Berlin is 18 degrees.”	System response to user alongside the continuing user input. For example, a visual marker is introduced alongside a video feed.	System response to change in system state by changing the system. For example, turning on the lights and music when user comes home.
User response	User interprets the presented information. May be followed up by a new information request.	User decides to either ignore or react to the presented information, possibly adjusting the presented input stream.	User response not required; user might not be aware of AI intervention.

¹⁴Van Berkel et al. (2021). Human-AI interaction: intermittent, continuous, and proactive. *Interactions*, 28(6), 67-71.

Wait, have we achieved "human-machine symbiosis"?

Current Approaches to Human-Machine Symbiosis

Mixed-initiative interaction: Mixed-initiative interaction refers to a flexible interaction strategy in which each agent (human or computer) contributes what it is best suited at the most appropriate time.¹⁶

Human-AI collaboration: ... collaboration [is] an evolving, interactive process whereby two or more parties actively and reciprocally engage in joint activities aimed at achieving one or more shared goals... Human-AI collaboration then refers to the collaboration between single or multiple humans and AI systems.¹⁷

Human-machine teaming: ...a purposeful combination of human and cyber-physical elements that collaboratively pursue goals that are unachievable by either individually.¹⁸

¹⁶ Allen et al. (1999). Mixed-initiative interaction. *IEEE Intelligent Systems and their Applications*.

¹⁷ Lai et al. (2021). Human-AI collaboration in healthcare: A review and research agenda. *HICSS 2021*.

Related Concepts

autonomous /ɔ'tanəməs/ *adj.* Of a process: self-initiating or self-sustaining; occurring or developing spontaneously.

automated /'ɔdəmeɪdɪd/ *adj.* Converted so as to operate automatically; that has been automated; automatic.

initiative /ɪ'nɪʃədɪv/ *n.* That which initiates, begins, or originates; the first step in some process or enterprise; hence the act, or action, of initiating or taking the first step or lead; beginning, commencement, origination.

Bringing These Ideas Together

- » Users directly interact with AI-driven features (i.e., AI-driven features are not only doing automated work in the background without the user's knowledge)
- » The user's goal is modeled into the system
- » The user and the system know each other's responsibilities (at any given time)
- » Who does what is based on capabilities

Human-autonomy¹⁹ collaboration: Human collaboration with autonomous features of an interactive system where the human and the system work toward a shared goal and perform tasks that best fit their capabilities.

¹⁹ Substitute with AI, AI-based system, AI-based capabilities, autonomous capabilities depending on context

An Example: Human-Robot Teaming in Assembly²⁰

²⁰[ErgoPack via YouTube](#)

How do know who (human/AI) does what best?

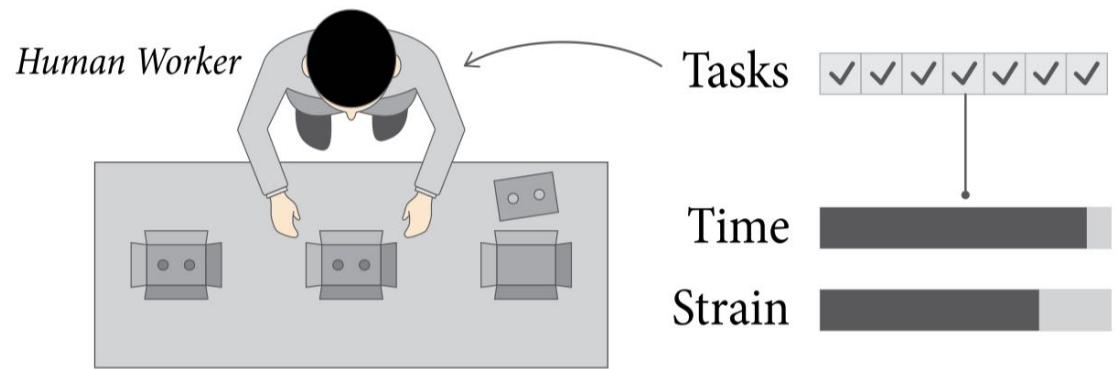

An Example Approach

Research Question: How do we translate a manual process into a human-autonomy process?²¹

1. Model manual process
2. Allocate tasks to user + autonomy
3. Identify effects to identify optimal allocation

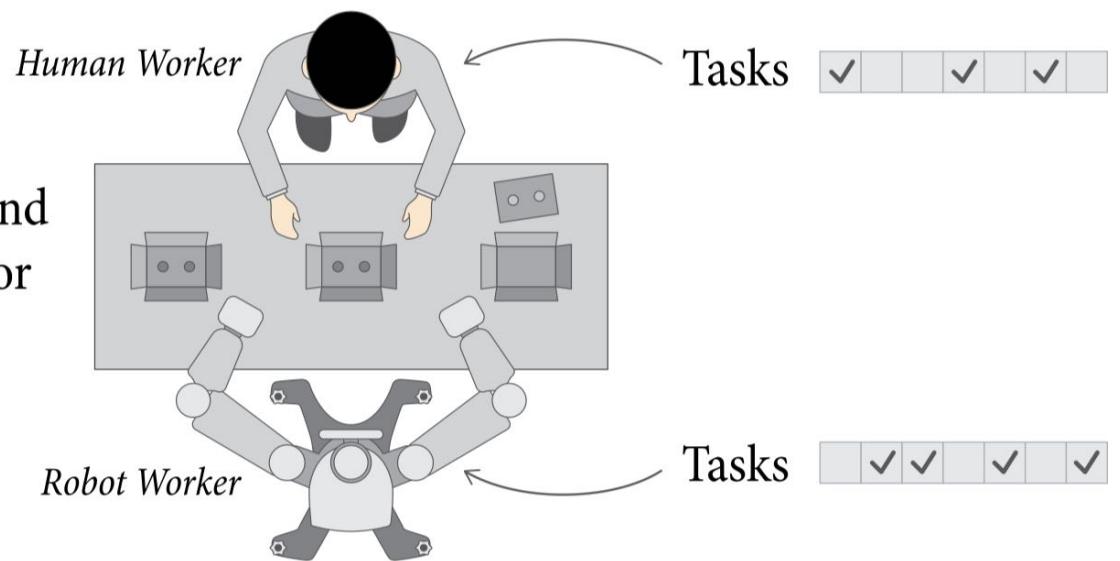

1

Observe process and measure time, strain

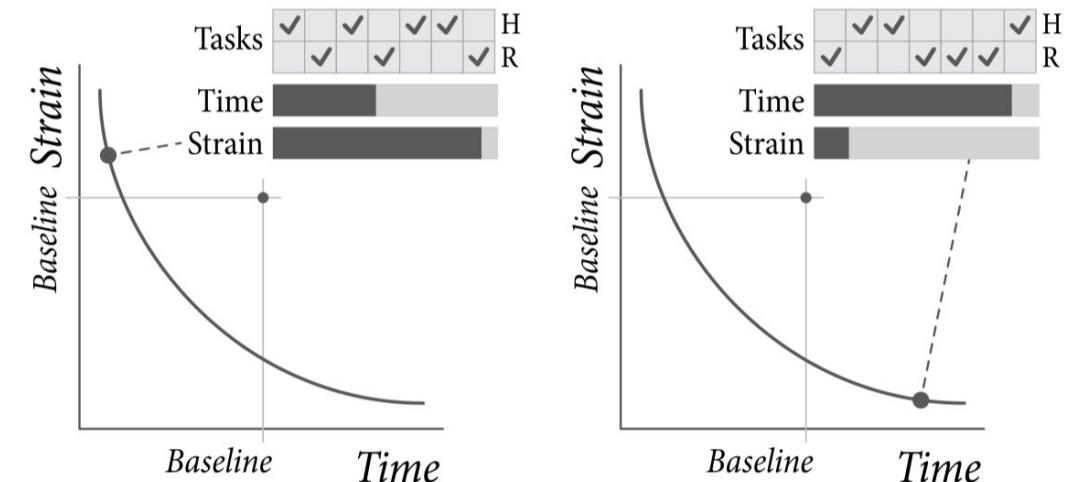

2

Introduce robotic partner and optimize task allocations for minimal time, strain

3

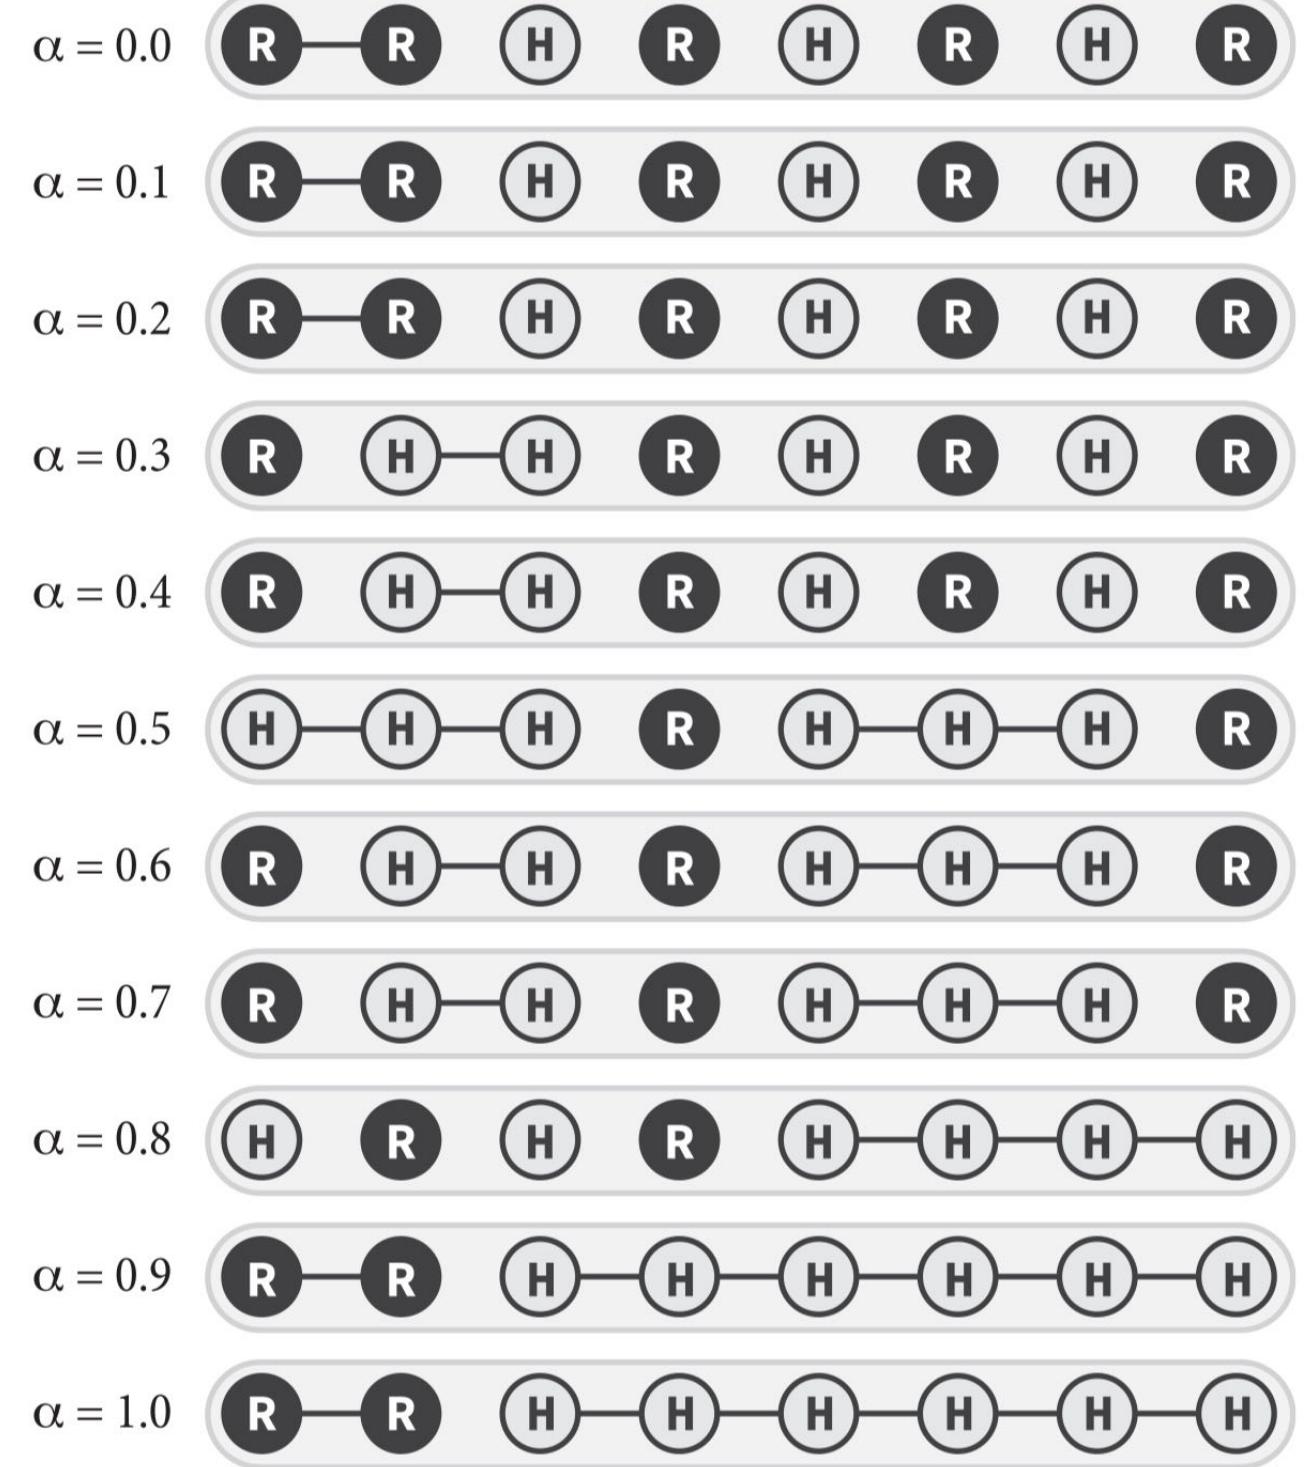

Analyze tradeoffs between minimizing time and minimizing strain

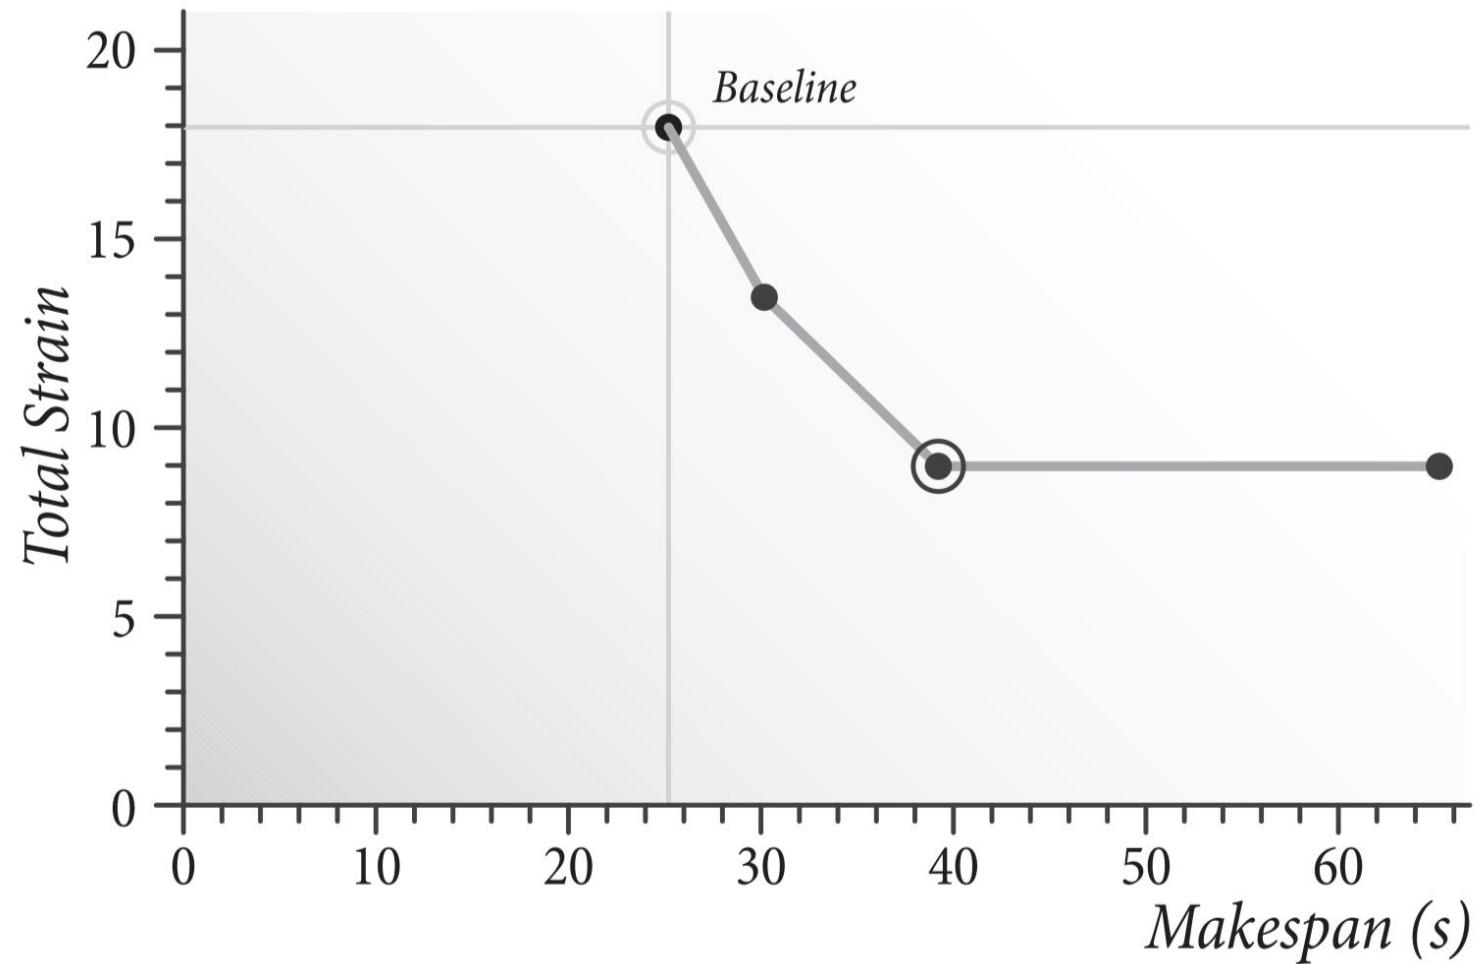

²¹Pearce et al. (2018). Optimizing makespan and ergonomics in integrating collaborative robots into manufacturing processes. *IEEE TASE*.

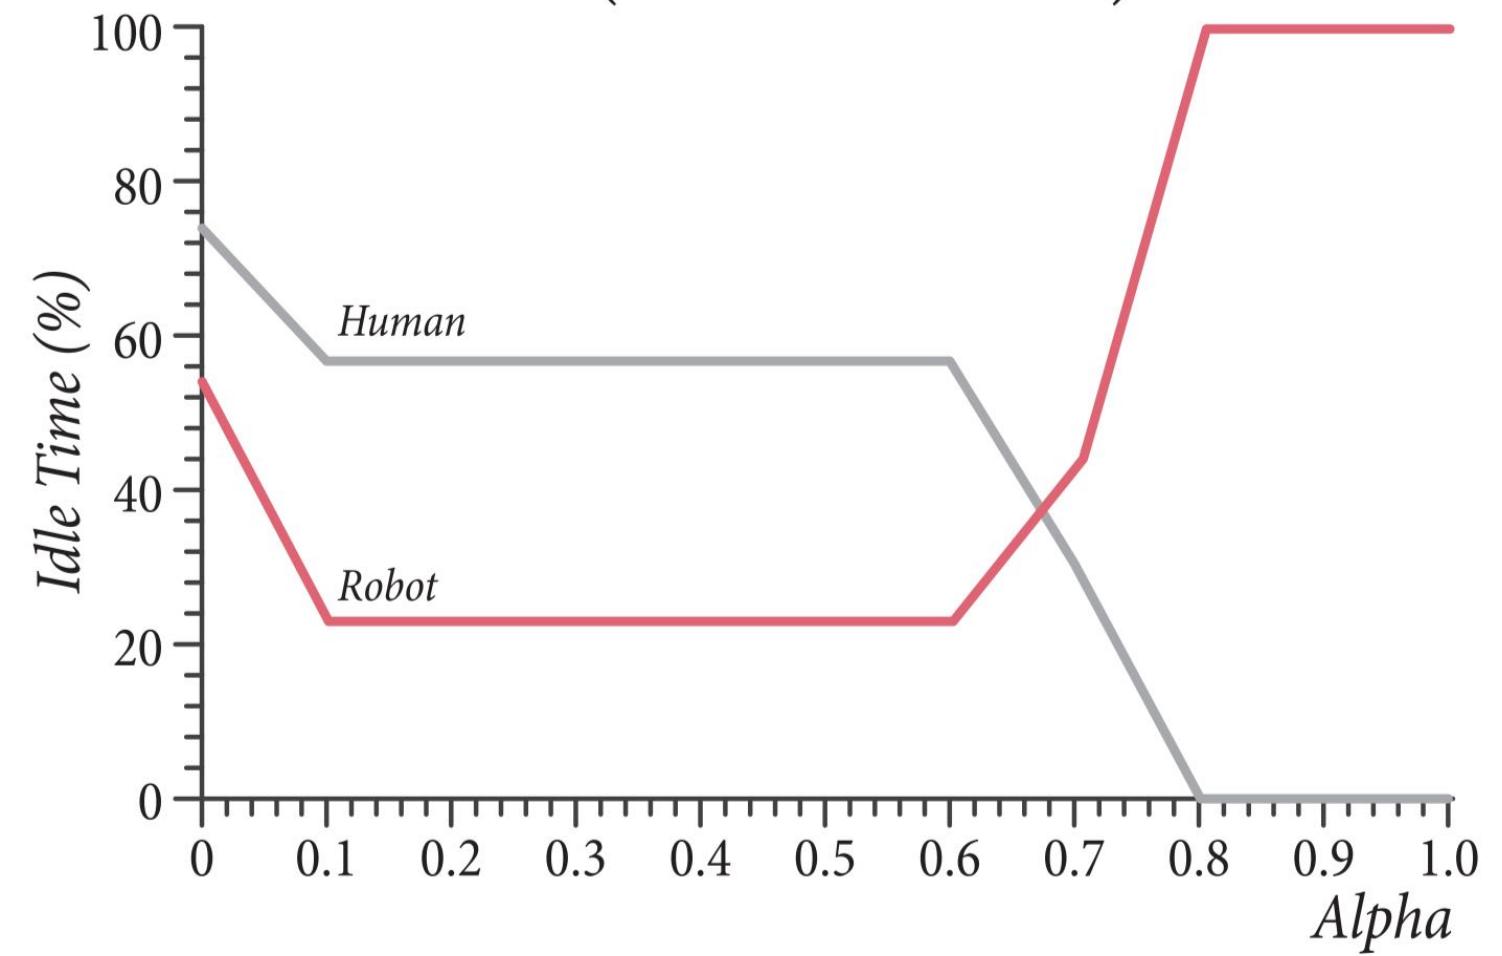

Work-element Assignments for T1 (Steelcase Task 1)

T2 (Steelcase Task 2)

T2 (Steelcase Task 2)

How do we make sense of different forms of human-AI interaction?

Mixed-Initiative Levels¹⁶

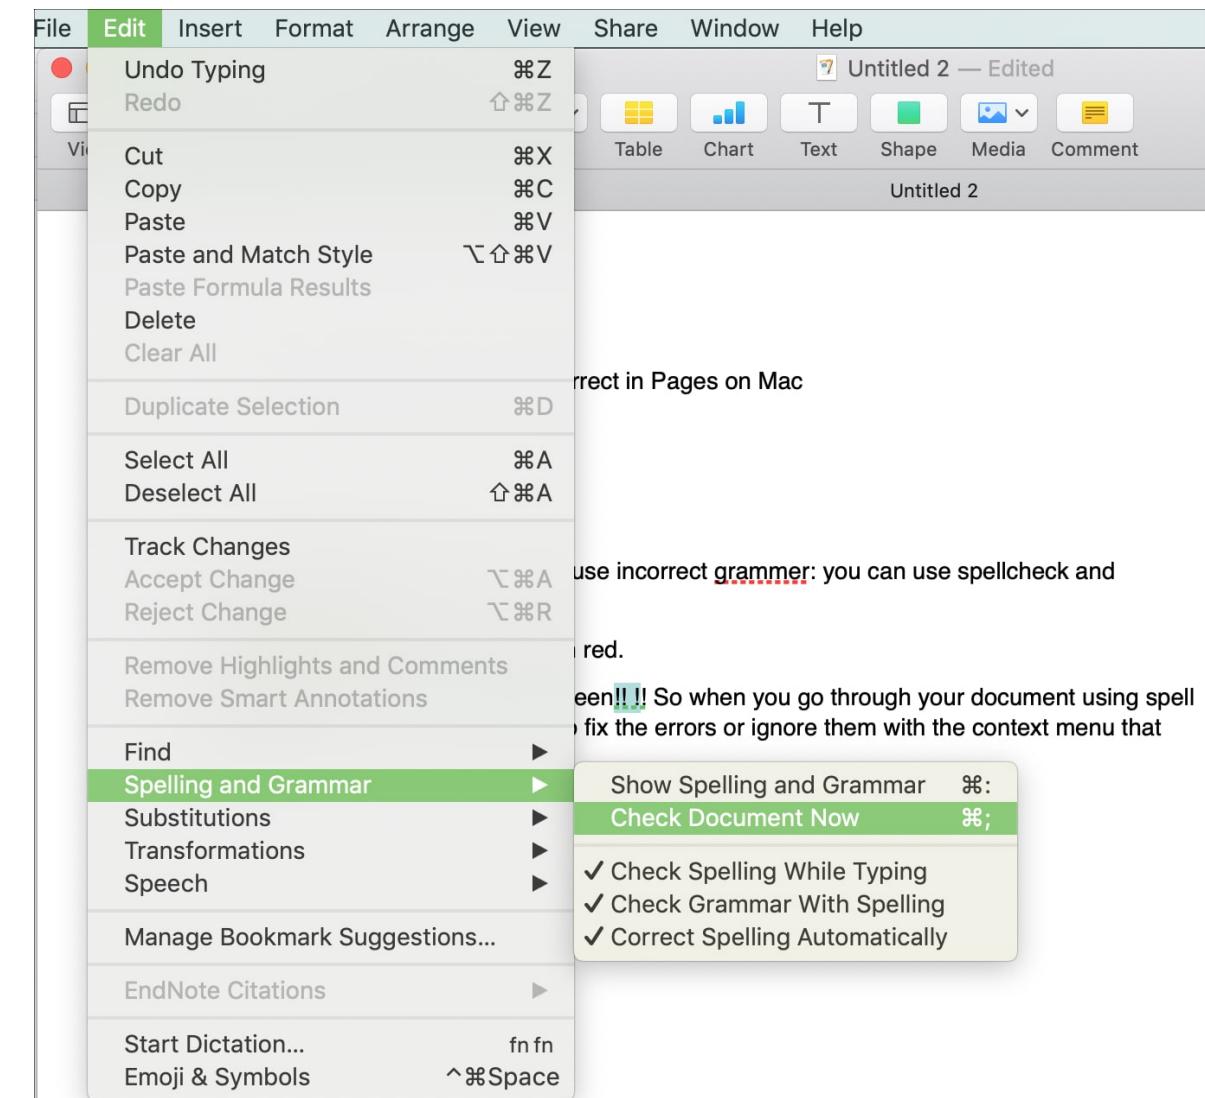

Mixed-initiative levels	Capabilities
Unsolicited reporting	Agent may notify others of critical information as it arises
Subdialogue initiation	Agent may initiate subdialogues to clarify, correct, and so on
Fixed subtask initiative	Agent takes initiative to solve predefined subtasks
Negotiated mixed initiative	Agents coordinate and negotiate with other agents to determine initiative

¹⁶ Allen et al. (1999). Mixed-initiative interaction. *IEEE Intelligent Systems and their Applications*.

Unsolicited Reporting²²

System continuously checks human work and reports on findings

Example: Automatic spellcheck

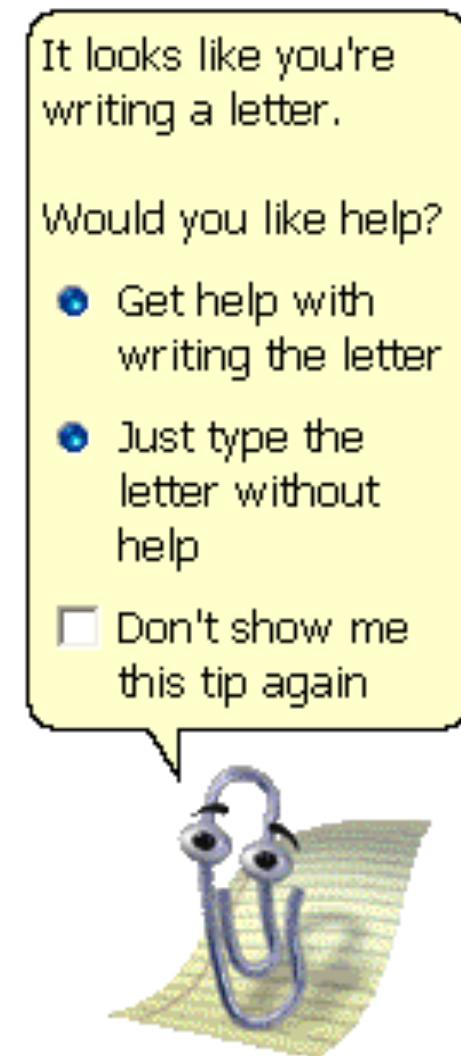

²²[Image](#)

Subdialogue Initiation²³

System engages in dialogue to get clarification from the user on whether help from autonomous features is needed

Example: Writing assistants

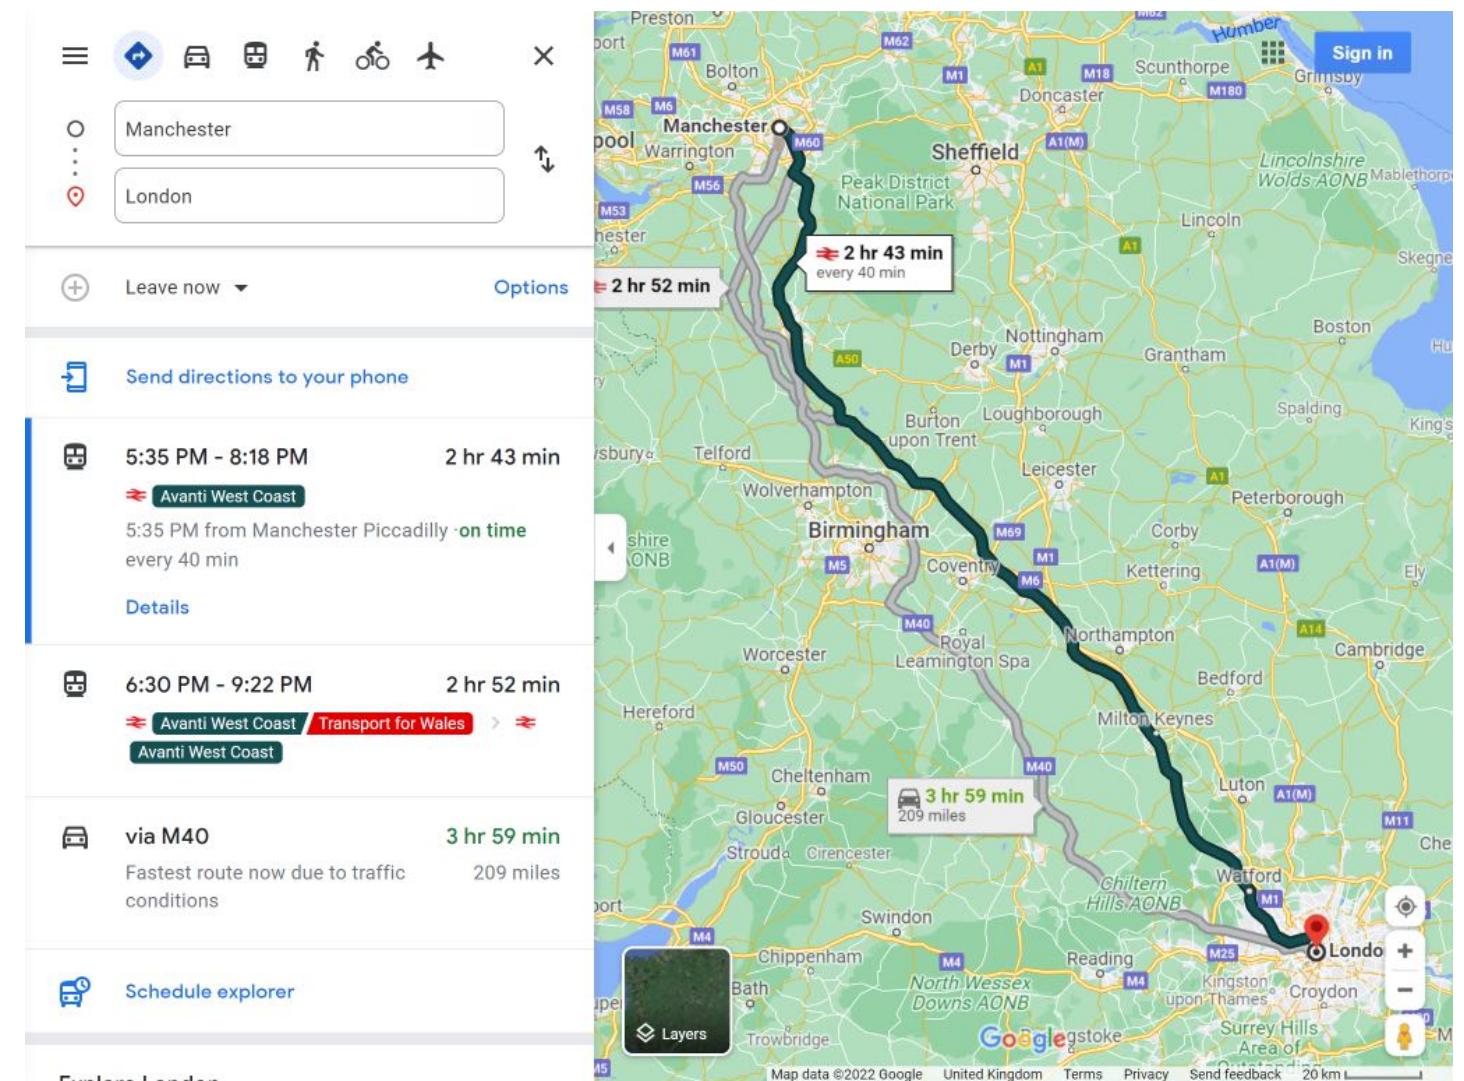

²³[Image](#)

Fixed Subtask Initiative²⁴

System engages in dialogue to get clarification from the user on whether help from autonomous features is needed

Example: Route planner

²⁴ [Image](#)

²⁹[Tesla via YouTube](#)

Negotiated Mixed Initiative²⁵

System constantly monitors, negotiates action, and/or takes initiative

Example: Autonomous breaking

²⁵ [IIHS via YouTube](#)

Other Classifications of Human-Autonomy Collaboration

Society of Automobile Engineers classification:²⁶

- » **Level 0:** No automation (e.g., manual driving, cruise control)
- » **Level 1:** Driver assistance (e.g., adaptive cruise control, lane-keep assist)
- » **Level 2:** Partial automation (automation of rudimentary tasks; e.g., lane centering)
- » **Level 3:** Conditional automation (automation under ideal conditions; e.g., autopark)
- » **Level 4:** High automation (automation except in poor conditions; e.g., snow)
- » **Level 5:** Full automation (driver is not required)

²⁶ SAE Standard J3016_202104

How do we design AI-infused systems?

Approaches to designing human-AI interaction

Two key approaches:

1. Inspiration from human collaboration (e.g., joint action²⁷)
2. Design guidelines (e.g., Amershi et al.¹)

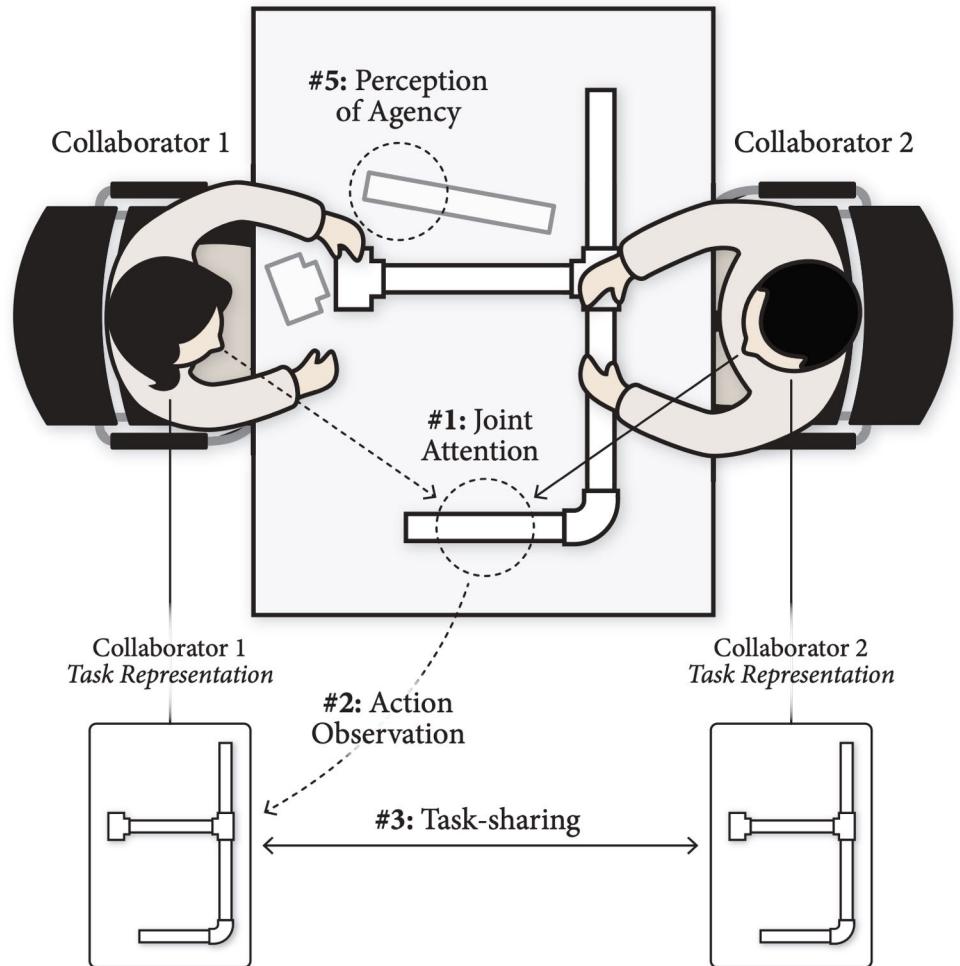

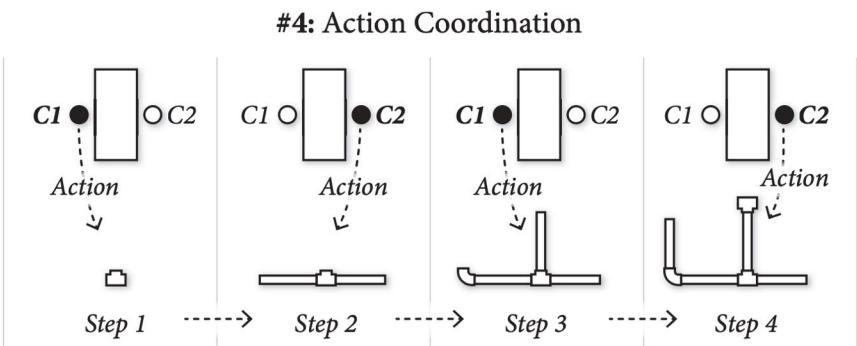

²⁷ Sebanz et al. (2006). Joint action: bodies and minds moving together. *Trends in cognitive sciences*.

¹ Amershi et al. (2019). [Guidelines for human-AI interaction](#). CHI 2019.

Coordination Mechanisms

Human collaboration mechanisms:²⁸

1. Joint attention
2. Action observation
3. Task sharing
4. Action coordination
5. Perception of agency

²⁸ Mutlu et al. (2013). *Coordination mechanisms in human–robot collaboration*. Workshop on Collaborative Manipulation.

Let's see this again:²⁹

²⁹[Tesla via YouTube](#)

Design Guidelines

Guidelines by Amerishi et al.¹:

1. Initially (G1–G2)
2. During interaction (G3–G6)
3. When wrong (G7–G11)
4. Over time (G12–G18)

¹Amershi et al. (2019). Guidelines for human-AI interaction. CHI 2019.

Example Guidelines¹

G9 Support efficient correction: *Make it easy to edit, refine, or recover when the AI system is wrong.*

[Voice Assistants, Product #2] “Once my request for a reminder was processed I saw the ability to edit my reminder in the UI that was displayed. Small text underneath stated 'Tap to Edit' with a chevron indicating something would happen if I selected this text.”

G13 Learn from user behavior: *Personalize the user's experience by learning from their actions over time.*

[Music Recommenders, Product #2] “I think this is applied because every action to add a song to the list triggers new recommendations.”

¹Amershi et al. (2019). Guidelines for human-AI interaction. CHI 2019.

Tradeoffs of Approaches

Model-based

- » Top-down
- » Higher generalizability
- » Limited coverage of corner cases

Design guidelines

- » Bottom-up
- » Case-based applicability
- » Limited use in conceptual design

(New) Discussion Format

Small group discussion ~10 minutes

- » Start a discussion in groups of 2-4
- » Discuss with your group members
- » You can use the shared doc for notes

Classroom discussion ~15 minutes

- » Questions/points from your small group discussion
- » Respond to others

Discussion Starters

- » What AI-infused systems do you use in your day-to-day lives?
- » What form of interaction do these systems offer (intermittent/continuous/proactive)?
- » What are challenges and limitations of interacting with these systems?
- » What are real-world examples of human-AI collaboration that you know?
- » Where else do you see potential for human-AI collaboration?
- » What are promising design approaches?
